                                                                                                                                                                                                                                                                                                                                                                 23-MAY-
                                                                                                                                                                                                                                                                                                                                                                                                   23-MAY-
                                                                                                                                                                                                                                       ö
hybridization tests, for genomic mapping and for detecting mutations. RGDI is used to treat or prevent disorders associated with increased apoptosis, e.g. acquired immune deficiency syndrome, neurodegenration, retinitis pigmentosa, aplastic anemia, ischemic injuries, and cirrhosis. RGDI is used to raise specific antibodies (Ab) or to screen for specific antagonists and agonists which are potential therapeutic agents. Antagonists of RGDI are used to treat abnormal cellular proliferation, e.g. many forms of cancer and inflammation such as allergy, Crohn's disease and multiple sclerosis. Ab are used as therapeutic antagonists disease and multiple sclerosis. Ab are used as therapeutic antagonists RGDI-related diseases, in competitive drugs), to diagnose and monitor from natural sources. This sequence represents the human RGDI protein described in the method of the invention.

This sequence represents a secreted human protein encoded by the nucleic acid molecule designated Gene 75 from the human cDNA clone HBIAB39 (deposited as clone ATCC 97900 and ATCC 209046).

The gene can be used to generate fusion proteins by linking to the gene to a human immunoglobulin FC portion (e.g. AAV59502) for increasing the stability of the fused protein as compared to the human protein only.

The invention relates to 186 novel genes and their fragments (nucleic acid sequences: AAV59511-V59812; amino acid sequences AAW74731-W75026) which are useful for preventing, treating or ameliorating medical conditions e.g. by protein or gene therapy. Also, pathological conditions e.g. by determining the amount of the new polypucleotides in a sample or by determining the presence of mutations in the new polypucleotides. Specific uses are described for each of the 186 the new polymucleotides. Specific uses are described for each of the 186 the new polymucleotides.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö

AADO8404-AADO8478 represent cDNAS corresponding to 24 human secreted protein genes, and AAE04170-AAE04170 represent the protein fragments of the secreted proteins they encode. The secreted proteins and their genes are useful for preventing, treating or ameliorating medical conditions, e.g., by protein or gene therapy.

Cor ameliorating medical conditions, e.g., by protein or gene therapy. Cor ameliorating medical conditions and be diagnosed by determining the amount of the pathological conditions can be diagnosed by determining the amount of the correction in a sample or by determining the presence of mutations in the new genes. Specific uses are described for each of the 24 genes, the new genes. Specific uses are described for each of the 24 genes, the new genes. Specific uses are described for each of the 24 genes, correctly cancer, tumours, foetal and developmental abnormalities, discaders, cancer, tumours, discases of the immune system, AIDS, autoimmune conditive disorders (e.g., Alzheimer's discase, Parkinson's disease), conditive disorders, cantantials, sepsis, diabetes, atherosclerosis, cardiovascular disorders, conditive disorders, and decental disorders, and downd healing and epithalial cell or proteins can also be used to aid wound healing and epithalial cell conference tissues, to identify their cognate ligands or binding to partners, and in chemotaxis, and can be used as a food additive or preserved the amount of preserved to modify storders. An allowascular disorders or preserved to modify storders and in chemotaxis, and compare injamics or binding to partners, and in chemotaxis, and the used as a food additive or preserved to modify storders and in chemotaxis, and the used as a food additive or preserved to an another or an analysis of the partners and in chemotaxis, and the partners and in chemotaxis, and in allowable in the partners and in chemotaxis, and in a partners and in chemotaxis, and in allowable in the partners and in chemotaxis, and in chemotaxis, and in chemotaxis, and in chemotaxis, 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         protein of the invention can be used in alleviating symptoms associated with the disorders mentioned above, and in diagnostic immunoassays e.g., radioimmunoassay or enzyme linked immunosorbent assay (ELISA). The present sequence represents a human secreted protein fragment referred to in the disclosure of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps

The femA nucleic acids can also be used in therapeutic applications. They can also be used to identify inhibitors, e.g. antibodies or antisense oligonucleotides, for blocking expression of the femA nucleotide sequences. They can also be used for producing vaccines against Staphylococci infections.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            based on the consensus feam nucleotide sequence which are used to develop products for the identification, detection and therapy of infections. The oligonucleotides can be used for the genetic amplification, the identification and/or quantification of various fema sequences which are specific to known or unknown Staphylococi species. Since the fema sequence is similar to the fema sequence, the oligonucleotides can also be used for the molecular genotyping of femB
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 This invention describes novel Staphylococcus-specific oligonucleotides
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human; open reading frame; ORFX; detection; cytostatic; hepatotropic;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 37.3%; Score 44; DB 20; Length 427; 35.5%; Pred. ANCHAAD TO ARAL/PUD ENCOUE THE PROTECTING 91/04-01. TO ARAL/S27,
which represent the human ORFX open reading frames 1 to 3161. The ORFX
caquences have activities such as: cytostatic; hepatotropic; vulnerary;
antipsoriatic; antiparkinsonian; nootropic; neuroprotective;
csteophathic; anticonvulsant; antiarthritic; immunosuppressant;
immunostimulant; cardiant; thrombolytic; coagulant; vasotropic;
antidiabetic; hypotensive; dermatological; immunosuppressant;
immunostimulant; cardiant; thrombolytic; coagulant; vasotropic;
antidiflammatory; antibacterial; antiviral; antifleumatic;
antidiflammatory; antibacterial; antiviral; antifleumatic;
antithyroid; and antidanemic. The sequences can be used for determining
the presence of or predisposition to, or preventing or treating
pathological conditions associated with an ORFX-associated disorder. The
nucleic acids can be used to express ORFX proteins in gene therapy
vectors: The proteins and nucleic acids may be used to treat cancers,
proliferative disorders, neurodegenerative disorders, osteoarthritis,
grafit vs host disease, cardiovascular disease; diabetes mellitus,
cythematosus, severe combined immunodeficiency (SCID), AIDS, viral,
bacterial or fungal infection, malaria, autoimmune disorders, asthma,
allergies, aplastic aneemia, burns, wounds, bone and cartilage damage,
nocturnal haemoglobinuria, antiinfilammatory disease; to enhance
coagulation; to inhibit thrombosis; and as a contraceptive.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö

The present invention provides a number of nucleotide and protein sequences from the Coryneform bacterium Corynebacterium glutamicum. These are useful for identifying the mutation point of a gene derived from a mutant of coryneform bacterium, measuring expression amount and analysing the expression profile or expression pattern of a gene derived from coryneform bacterium, and identifying a homologue of a gene derived from coryneform bacterium, Coryneform bacterium, coryneform bacterium, and identifying a homologue of a gene derived from coryneform bacterium. Coryneform bacterium coryneform bacterium in the useful for producing amino acids, nucleic acids, vitemins, saccharides and organic acids, particularly L-lysine. The present sequence is a protein described in the examplification of the invention.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from the European Patent Office.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Novel polynucleotides derived from Coryneform bacteria, for identifying mutation point of a gene, measuring expression of a gene, analysing expression profile or pattern of a gene and identifying homologous gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Corynebacterium glutamicum; carbon metabolism and energy production;

```
metabolism and oxidative phosphorylation (SMP) proteins given in metabolism and oxidative phosphorylation (SMP) proteins given in AAB79243 to AAB 79633 which are involved in carbon metabolism and energy production. The C. glutamicum SMP gene can be used in vectors energy production. The C. glutamicum SMP gene can be used in vectors production of fine chemicals, such as, an organic acid, a proteinogenic or nomproteinogenic amino acid (preferred), a purine or pyrimidine base, or nomproteinogenic amino acid (preferred), a purine or pyrimidine base, a nucleoside, a nucleotide, a lipid, a saturated or unsaturated fatty acid, a diol, a carbohydrate, an aromatic compound, a vitamin, a cofactor, a polyketide, or an enzyme. The presence of (I) or SMP proteins (III) encoded by them are used for diagnosing the presence or activity of corynebacterium diphtheriae in a subject. (I), (II), (III) or host cells containing them are used to map genomes of organisms related to
SMP protein; sugar metabolism and oxidative phosphorylation protein; fine chemical production; organic acid; proteinogenic amino acid; nonproteinogenic amino acid; purine base; pyrimidine base; nucleoside; nucleotide; lipid; saturated fatty acid; unsaturated fatty acid; diol; carbohydrate; aromatic compound; vitamin; cofactor; polyketide; enzyme; diagnosis; Corynebacterium diphtheriae; evolutionary study.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New isolated Corynebacterium glutamicum nucleic acid encoding a sugmetabolism and oxidative phosphorylation protein for production or modulation of production of fine chemicals e.g. amino acids, carbohydrates or enzymes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Haberhauer G;

Involved in cofactor metabolism.

The protein may be used in a vaccine to prevent or treat H. pylori

Infection or to identify H. pylori polypeptide binding compounds,

Useful as potential H. pylori life cycle activators or inhibitors.

Useful as potential H. pylori life cycle activators or inhibitors.

The genomic sequence of H. pylori (ATCC 55679) was determined from

The genomic sequence of H. pylori antigent of the least 180 nucleotides,

Overlapping contigs generated by mechanically shearing the bacterial

Overlapping contigs generated by mechanically shearing the bacterial

Overlapping contigs generated by mechanically shearing the bacterial

Coverlapping contigs generated by mechanically shearing the bacterial

Coverlapping contigs generated by mechanically shearing the bacterial

Coverlapping contigs of the pylori antigens for vaccine development, the aminor defined sequences predicted from various ORF were analysed for significant and determined the sequences of interest, particular regions can be insolated from H. pylori by PCR amplification for recombinant polypeptide

Coli hosts.

                               The sequence is that of the human CENP-C antigen which may be recombinantly produced in large amts. Thus the polypetide is available to more accurately classify patients with such autoimmune rheumatic diseases as CREST syndrome, and commercially useful quantities are available for use in diagnostic systems.

This sequence is a H. pylori secreted or periplasmic protein.

The protein may be used in a vaccine to prevent or treat H. pylori infection or to identify H. pylori polypeptide binding compounds, useful as potential H. pylori life cycle activators or inhibitors.

The genomic sequence of H. pylori (ATCC 55679) was determined from overlapping contigs generated by mechanically shearing the bacterial overlapping contigs generated by mechanically shearing the bacterial overlapping the predicted coding regions defined by computer evaluation. To identify likely H. pylori antigens for vaccine development, the amino acid sequences predicted from various ORF were analysed for significant hand determined the sequences of interest, particular regions can be included from H. pylori by PCR amplification for recombinant polypeptide isolated from H. pylori hosts.

Useful as potential H. pylori life cycle activators or inhibitors. The genomic sequence of H. pylori (ATCC 5579) was determined from overlapping contigs generated by mechanically shearing the bacterial DNA. The sequences were analysed for ORF of at least 180 nucleotides, DNA. The sequences were analysed for one of the computer evaluation. To identify likely H. pylori antigens for vaccine development, the amino acid sequences predicted from various ORF were analysed for significant homology to other known or exported membrane proteins. Having identified and determined the sequences of interest, particular regions can be isolated from H. pylori by PCR amplification for recombinant polypeptide production, e.g. in E. coli hosts.

The peptide has an ability to promote formn. of B.subtilis extracellular protease. It is expressed in B.subtilis in high yield.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     DNA fragment encoding specific amino acid sequence · promotes formation of Bacillus subtilis extracellular protease.
                                                                                                                                                 SacUS2 confers DegU phenotype, and is encoded by part of the 2.55 kb Sall-Sphl SacU locus. This can restore levan saccharase synthesis in B. subtilis sacU- mutants, and overproduces proteins in this or other microorgansisms.
                                                   DNA contg. Bacillus subtilis sacU locus - for inducing overproduction in microogansisms
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Peptide which promotes formn. of B. subtilis extracellular protease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö

AAH52304 to AAH53970 represent nucleic acids (I) encoding polypeptides (II), given in AAG81454 to AAG83120, from Staphylococcus epidermidis.

(I) and (II) can have antibacterial activity and therefore can be used in vaccination. The nucleic acids (I) may be used to produce the S. epidermidis polypeptides (II) via the production of vectors containing them which are used to produce hosts cells which express the polypeptides. The polypeptides (II) fand/or nucleic acids) may then be used to vaccinate subjects and to raise antibodies against the bacteria. The polypeptides may also be used to assay for other inhibitors of their reatment of S. epidermidis infections, e.g. endocarditis. AAH53971 to AAH5509 represent specifically claimed S. epidermidis genomic DNA polynucleotide sequences from the present invention. AAH55091 to AAH5509 represent oligonucleotide sequences and primers which are used in the exemplification of the present invention. AAH5501 to sequences given in the sequence listing of the present specification, because the secuence is the present specification, however the sequence listing of the present specification, however the sequences are given in the disclosure for SEQ ID NO:4454 so even though sequences are present for SEQ ID NO:4455 to 4472, no sequences are present for SEQ ID NO:4455 to 4472,
Claim 18; Page 519; 2188pp; English.

Gaps

This polypeptide comprises cellulase celA of Orpinomyces sp. strain OC-2, an anaerobic bovine rumen fungus Orpinomyces sp. PC-2. Its amino acid sequence was deduced from an isolated CDNA clone (see AAV5941). CelA has endoglucanase and cellobiohydrolase activity, with highest activity at pH 4.8 and 50 degC. CelB (see AAW56742) and celC (see AAW56739) cellulolytic enzymes of Orpinomyces sp. PC-2 are also proteins are claimed, as well as recombinant cells selected from Saccharomyces cerevisiae, Escherichia coli, Aspergillus, Trichoderma reesei, Pichia, Penicillium, Streptomyces or Bacillus, and a method for producing recombinant cellulase by

culturing these host cells.

Sequence

New recombinant DNA encoding Orphnomyces cellulase protein - useful for, e.g. producing recombinant Orpinomyces cellulase in host cell

```
This sequence is a Drosophila melanogaster accessory gland protein (Acp) of the invention. A particular Acp, designated Acp62F, is toxic to insects, particularly to Drosophila and caterpillars, and it (or vectors that express it) can be used to kill or inhibit development of insect pests, for plant protection. More generally detection of Acp's in a female fruit fly is indicative of recent mating.
                                                                                                                                                                                                                                                                                                                                                                                                               Accessory gland protein; Acp; toxin; insecticide; Drosophila; mating; caterpillar; development inhibitor; insect pest; plant protection.

ANY54086-99 represent enzymes involved in the biosynthesis of
exopolysaccharides (EPS). These enzymes are designated EPSA-EPSN, and
are encoded by open reading frames epsA-epsN. The enzymes are isolated
from Lactobacillus delbrueckii bulgaricus. The proteins are used
in a method for the synthesis of EPS, which includes at least one step
of forming a bond (alpha or beta-isomer) between C-1 (carrying the
ce of forming allehyde function, of an activated D-galactose pyranose), and
ce phosphate on a lipophilic or proteinaceous primer. Stepwise synthesis
of EPS occurs with in each step, addition of a new sugar unit, through
its heari-acetyl function, to an alcoholic hydroxyl of a second sugar
out, present at the end of a chain of sugar residues bonded to the
primer. EPSA is attenuator of transcription which influences
ce primer. EPSA is attenuator of transcription which influences
involved in the control of the molecular weight and/or the length of the
polysaccharide; EPSD, EPSL and EPSM are involved in synthesis of EPS;
EPSE is a glactosy- or glucosyl-phospho-transferase which catalyses the
transfer of the first saccharide on the primer; EPSF and EPSG are
calpha-glycosyltransferases; EPSG is a glucosyltransferase; EPSK is

ANY 43788-89, AAY 43791-Y437801 and AAY 43842 represent the enzymes encoded by the eps operon of Lactobacillus delbrueckii bulgaricus Lfi5. The operon contains 14 open reading frames, and encodes enzymes (epsh, epsC, epsD, epsE, epsE, epsC, epsB, epsC, epsE, epsC, epsC,
responsible for the polymerisation of the repetitive units; and EPSN is responsible for export of the EPS. The EPS enzyme are used to improve properties of foods, particularly fermented milk products such as yoghurt and cheese, e.g. their organoleptic properties and flavour stability.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New recombinant enzymes for biosynthesis of exopolysaccharides having e.g. antitumor or problotic properties or useful in fermented milk

cequences AAB38321-B38396 represent the amino acid sequences of 62
human secreted proteins encoded by the genes AAC69512-C69587. The genes
and proteins are useful for preventing, ameliorating or treating medical
conditions, e.g. by protein or gene therapy. The genes are isolated from
a range of human tissues disclosed in the specification. The nucleic
acids, proteins, antibodies and (antipagonists are useful in the
cidsnosis, treatment and prevention of: (a) autoimmune diseases e.g.
chagnosis, treatment and prevention of: (a) autoimmune diseases e.g.
rheumatoid arthritis; (b) hyperproliferative disorders e.g. neoplasms
of the breast or liver; (c) cardiovascular disorders e.g. cardiac
arrest; (d) carebrovascular disorders e.g. cardiac
infections caused by bacteria, viruses and fung; and (h) ocular
disorders e.g. corneal infection. The polypeptides can also be used to
disorders e.g. corneal infection. The polypeptides can also be used to
ading due to sunburn, to maintain organs before transplantation, for
supporting cell culture of primary tissues, to regenerate tissues and in

buman secreted proteins encoded by the genes AAC69512-C69587. The genes and proteins are useful for preventing, ameliorating or treating medical conditions, e.g. by protein or gene therapy. The genes are isolated from a range of human tissues disclosed in the specification. The nucleic acids, proteins, antibodies and (ant)agonists are useful in the acids, proteins, antibodies and (ant)agonists are useful in the chematoid arthritis; (b) hyperproliferative disorders e.g. neoplasms of the breast or liver; (c) cardiovascular disorders e.g. cardiac arrest; (d) cerebrovascular disorders e.g. cardiac arrest; (d) cerebrovascular disorders e.g. cerebral ischemia; (e) infections caused by bacteria, viruses and fungi; and (h) ocular disorders e.g. corneal infection. The polypeptides can also be used to all wound healing and epithelial cell proliferation; to prevent skin

The gene was used in a new method for controlling the morphogenesis of plant organs comprising regulating the expression of the gene using ectopic expression. Such a method can be used to determine and control plant organ morphogenesis, such as modifying petals without altering the reproductive portions of

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                å
                                                                                                                                                                                                                                      ó
                              the tag7 DNA sequence are used to express recombinant tag7 is used to produce and purify antibodies; to inhibit growth of mammalian tumours, especially for treating carcinoma (of liver, ovary, breast, cervix, lung, prostate, colon/rectum, bladder, testis, stomach, pancreas, mouth, head and neck, squamous cell carcinoma or teratocarcinoma), sarcoma (Kaposi's, osteo or fibro-sarcomas), melanoma or leukaemia; and as a molecular weight marker. The tag7 polypebtide inhibits tumour growth and induces apoptosis. The tag7 coding sequences are also useful as probes for gene mapping and detection of tag7 gene expression, and as prihars. Antibodies against tag7 are used as reagents for detecting tag7; for isolating tag7 and therapeutically to inhibit or delay tumour
                        sequence encodes the murine tag? of the invention. Cells containing

This cDNA sequence encodes the precursor (see AAW23723) of a novel, claimed antimicrobial peptide from bovine neutrophils, designated murine granulocyte peptide A or MGP-A (see AAW23725). It was isolated from murine bone marrow CDNA using primers based on bovine BGP-A cDNA (see AAW3725). It was comprises signal peptide and propeptide sequences followed by 12 c-terminal amino acids corresponding to mature MGP-A mid amino acids corresponding to mature MGP-A and Gram-negative bacteria, fungi and viruses, specifically Staphylococcus aureus, Escherichia coli, Candida albicans, Salmonella typhimurium and C. neoformans (claimed). They can be used in human or veterinary medicine (particularly to treat disorders associated with lipopolyaccharides, e.g. sepsis and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  gtgcccgcagtgagtggaggcctgccatccgagtgctctagccgcctggggcaccca 120

This sequence is a PCR primer for DNA encoding the murine tag7 of the invention. Cells containing the tag7 DNA sequence are used to express recombinant tag7. Tag7 is used to produce and purify antibodies; to inhibit growth of mammalian tumours, especially for treating carcinoma (of liver, ovary, breast, cervix, lung, prostate, colon/rectum, bladder, testis, stomach, pancreas, mouth, head and neck, squamous cell carcinoma or teratocarcinoma), sarcoma (Kaposi's, osteo- or fibro-sarcomas), melanoma or leukaemia; and as a molecular weight marker. The tag7 polypeptide inhibits tumour growth and induces apoptosis. The tag7 coding sequences are also useful as probes for gene mapping and detection of tag7 gene expression, and as primers. Antibodies against tag7 are used as reagents for detecting tag7; so as an antagonist of tag7; for isolating tag7 and therapeutically to inhibit or delay tumour metastasis.

This sequence is a PCR primer for DNA encoding the murine tag7 of the invention. Cells containing the tag7 DNA sequence are used to express recombinant tag7. Tag7 is used to produce and purify antibodies; to inhibit growth of mammalian tunmours, especially for treating carcinoma (of liver, ovary, breast, cervix, lung, prostate, colon/rectum, bladder, testis, stomach, panceas, mouth, head and neck, squamous cell carcinoma or teratocarcinoma, sarcoma (Raposi's, osteo- or fibro-sarcomas), polypeptide inhibits tumour growth and induces apoptosis. The tag7 coling sequences are also useful as probes for gene mapping and detection of tag7 gene expression, and as primers. Antibodies against tag7 are used as reagents for detecting tag7; as an antagonist of tag7; for isolating tag7 and therapeutically to inhibit or delay tumour metastasis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö

The human secreted protein gene #8 and protein sequences are represented in sequences AAA80613 and AAB25583. Sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention relates to 12 secreted human proteins and the nucleotide sequences encoding them. The polynucleotide sequences given in AAB0606-AB06023 encode the 12 secreted protein sequences given in AAB05576-B25593. The human secreted proteins have various activities dependent on the tissues in which they are expressed. Examples of the activities of the proteins include: immunosuppressant. antilammatory; antiarthritic; antirheumatic, dermatological; antiproliferative, antiarthritic; antirheumatic, dermatological; antiproliferative, antiarthritics antirheumatic, wilnerary; antiviral; antibacterial; and antifungal activity. The proteins, polypeptides, agonists and antagonists may be used to treat prevent and/or diagnose various disease, disorders and conditions examples of which include: immune disorders e.g. Addison's disease, rhemmatoid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  AAA80662-A80663 represent genes related to the secreted protein gene#8
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Isolated nucleic acid molecules encoding human secreted proteins are used for the prevention, amelioration and treatment of autoimmune, inflammatory, hyperproliferative and cardiovascular disorders, cancer, wounds, and infectious diseases
                                                                                 Human secreted protein gene #8 related gene HBMTB79R SEQ ID #115.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Sequence 285 BP; 71 A; 99 C; 62 G; 47 T; 6 other;

The present invention describes an antibody that binds to a human protein (I) selected from: PRO181; PRO1269; PRO1410; PRO1755; PRO1780; PRO344; PRO1927; PRO1567; PRO1295; PRO12039; PRO14034; PRO1934; PRO1934; PRO1935; PRO18035; PRO18034; PRO1934; PRO1905; PRO1906; PRO1908; and PRO2626. (I) has anticancer activity and cam be used to diagnose tumours in mammals, by detecting complex formation when the antibody is contacted with test cells. Increased expression of genes encoding (I) can also be detected to diagnose tumours. Agents which inhibit the activity of (I), especially the antibodies, or an antisense oligonucleotide which hybridises to genes encoding (I), can be used to inhibit tumour growth, preferrably by inducing cell death. Methods from the present invention can be used to identify compounds which inhibit the biological activity of (I). AACS8019 to AACS8012 represent PCR primers and hybridisation probes used in examples from the present invention for human PRO sequences. AACS8103 to AACS8122 and AAB24021 to AAB24040 represent human sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Antibodies specific for PRO polypeptides, used to diagnose and inhibit the growth of tumors in mammals, and to identify inhibitors of PRO polypeptide activity or expression -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps

AAA37022 to AAA37144 encode the new isolated human transmembrane, receptor or secreted PRO polypeptides given in AAY99340 to AAY99462. The transmembrane and receptor PRO proteins can be used for screening of potential peptide or small molecule inhibitors of the relevant receptor/ligand interactions. The polypeptides and nucleotide sequences encoding then have various industrial applications, including uses as pharmaceutical and diagnostic agents. AAA37145 to AAA37330 represent PCR primers and hybridisation probes used in the isolation of the PRO
                                   New mammalian DNA sequences encoding transmembrane, receptor or secreted PRO polypeptides, useful for screening of potential peptide or small molecule inhibitors of the relevant receptor/ligand interactions
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Botstein D, Desnoyers L, Eaton DL, Ferrara N, daard A, Godowski PJ, Grimaldi CJ, Gurney AL, onl NF, ROY MA, Smith V, Stewart TA, Tumas D; K, Williams PM, WOOG WI;

This sequence encodes the human tag7 of the invention. Cells containing the tag7 DNA sequence are used to express recombinant tag7. Tag7 is used to produce and purify antibodies; to inhibit growth of mammalian tumours, especially for treating carcinoma (of liver, ovary, breast, cervix, lung, prostate, colon/rectum, bladder, testis, stomach, pancreas, mouth, head and neck, squamous cell carcinoma or teratocarcinoma), sarcoma (Kaposi's, osteo- or fibro-sarcomas), melanoma or leuksemia; and as a molecular weight marker. The tag7 polypeptide inhibits tumour growth and induces apoptiosis. The tag7 coding sequences are also useful as probes for gene mapping and detection of tag7 gene expression, and as primers. Antibodies against tag7 are used as reagents for detecting tag7; as an antagonist tag7; for isolating tag7 and therapeutically to inhibit or delay tumour metastasis.
                                                                                                                                                                                                                                                                                          ö
                                                    The present invention relates to secreted and transmembrane proteins. These proteins and the DNA encoding them may be used as hybridization probes, in chromosome and gene mapping and in the generation of anti-sense RNA and DNA. They may also be used used to generate either transgenic animals or knockout animals which are in turn useful for development and screening of therapeutically useful reagents. The nucleic acids may also be used in gene therapy.
                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Tag7; tumour growth inhibitor; mammalian tumour; carcinoma; sarcoma;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention relates to 12 secreted human proteins and the nucleotide sequences encoding them. The polynucleotide sequences given in AAB0006-AB0063 encode the 12 secreted protein sequences given in AAB25576-625593. The human secreted proteins have various activities dependent on the tissues in which they are expressed. Examples of the activities of the proteins include: immunosuppressant; antiarmatory; antiarthritic; antirheumatic, dermatological; antiproliferative; antiarteriosclerotic; anticancer; vulnerary; antiviral; antibacterial; and antifungal activity. The proteins, polypeptides, agonists and antagonists may be used to treat prevent and/or diagnose various disease, disorders and conditions examples of the beautiful antibacterial and antideced and antagonists may be used to treat prevent and/or diagnose various disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Isolated nucleic acid molecules encoding human secreted proteins are used for the prevention, amelioration and treatment of autoimmune, inflammatory, hyperproliferative and cardiovascular disorders, cancer,

The PGRP DNA and proteins are useful for preventing, treating or ameliorating a medical condition in a mammal (claimed). PGRP is useful in augmenting the immune system in such areas as immune recognition, antigen presentation and immune system activation. Antibodies or antagonists directed against these proteins may be useful in reducing or eliminating disorders

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Polynucleotide encoding peptidoglycan recognition protein-like protein, antibodies specific to it useful for preventing, treating conditions e.g. endotoxic shock and auto-immune disorders and infections in mammal
cancer e.g. melanoma and lymphoma. The proteins and polynucleotide sequences may also be used in wound healing and the treatment of infectious diseases. The human secreted protein gene #8 and protein sequences are represented in sequences AAA80613 and AAB2583. Sequences AAA80662-A80663 represent genes related to the secreted protein gene#8.

This sequence is a PCR primer for DNA encoding the murine tag7 of the invention. Cells containing the tag7 DNA sequence are used to express the recombinant tag7. Tag7 is used to produce and purify antibodies; to inhibit growth of mammalian tumours, especially for treating carcinoma (of liver, ovary, breast, cervix, lung, prostate, colon/rectum, bladder, testis, stomach, pancreas, mouth, head and neck, squamous cell carcinoma or teratocarcinoma), sarcoma (Kaposi's, osteo- or fibro-sarcomas) melanoma or leukaemia; and as a molecular weight marker. The tag7 polypeptide inhibits tumour growth and induces apoptosis; The tag7 coding sequences are also useful as probes for gene mapping and detection of tag7 gene expression, and as primers. Antibodies against tag7 are used as reagents for detecting tag7; as an antagonist of tag7; for isolating tag7

the 5'-end sequence/3'-end sequence is selected from those defined in the specification. The primers sets can be used in antisense therapy and in gene therapy. The primers are useful for synthesising polynucleotides, particularly full-length cDNAs. The primers are also useful for the detection and/or diagnosis of the abnormality of the proteins encoded by the full-length cDNAs. The primers allow obtaining of the full-length cDNAs. The primers allow obtaining of the full-length AAH13633 to AAH13641 represent human cDNA sequences; AAB92446 to AAH93633 represent human amino acid sequences; and AAH13629 to AAH13632 represent oligonucleotides, all of which are used in the exemplification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention describes primer sets for synthesising 5602 full-length cDNAs defined in the specification. Where a primer set comprises: (a) an oligo-dT primer and an oligonucleotide complementary to the complementary strand of a polynucleotide which comprises one of the 5602 nucleotide sequences defined in the specification, where the oligonucleotide comprises at least 15 nucleotides; or (b) a combination of an oligonucleotide comprising a sequence complementary to the complementary strand of a polynucleotide which comprises a 5'-end sequence and an oligonucleotide comprising a sequence complementary to a polynucleotide comprises a 3'-end sequence complementary to a polynucleotide comprises a 1'-end sequence complementary to a polynucleotide comprises at least 15 nucleotides and the combination of oligonucleotide comprises at least 15 nucleotides and the combination of
                                                                                                                                                                    Human; primer; detection; diagnosis; antisense therapy; gene therapy; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              primer sets for synthesizing polynucleotides, particularly the 5602 full-length cDMAs defined in the specification, and for the detection and/or diagnosis of the abnormality of the proteins encoded by the full-length cDNAs -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Yamamoto J;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Saito K,

(I) has anticancer activity and can be used to diagnose tumours in mammals, by detecting complex formation when the antibody is contacted with test cells. Increased expression of genes encoding (I) can also be detected to diagnose tumours. Agents which inhibit the activity of (I), especially the antibodies, or an antisense oligonucleotide which hybridises to genes encoding (I), can be used to inhibit tumour growth, preferrably by inducing cell death. Methods from the present invention can be used to identify compounds which inhibit the biological activity of can be used in examples from the present invention probes used in examples from the present invention of sequences. AAC58103 to AAC58102 and AAB24021 to AAB24040 represent human processing the properties of the present invention of the present human processing the properties of the proper

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention relates to secreted and transmembrane proteins. These proteins and the DNA encoding them may be used as hybridization probes, in chromosome and gene mapping and in the generation of anti-sense RNA and DNA. They may also be used used to generate either transgenic animals or knockout animals which are in turn useful for development and screening of therapeutically useful reagents.
                                                                                                                                                                                                                                                                                                                                                                                                Fong S;

the tag7 DNA sequence are used to express recombinant tag7. Tag7 is used to produce and purify antibodies; to inhibit growth of mammalian tumours sepecially for treating carcinoma (of liver, ovary, breast, cervix, lung, prostate, colon/rectum, bladder, testis, stomach, pancreas, mouth, head and neck, squamous cell carcinoma or teratocarcinoma), sarcoma (Raposi's, osteo- or fibro-sarcomas), melanoma or leukaemia; and as a molecular weight marker. The tag7 polypeptide inhibits tumour growth and induces apoptosis. The tag7 coding sequences are also useful as probes for gene mapping and detection of tag7 gene expression, and as probes for gene mapping are used as reagents for detecting tag7; sa an antagonist tag7; for isolating tag7 and therapeutically to inhibit or delay tumour
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              This sequence encodes the murine tag? of the invention. This cDNA sequence encodes the precursor (see AAM23723) of a novel, claimed antimicrobial peptide from bovine neutrophils, designated murine granulocyte peptide A or MGP-A (see AAM23725). It was isolated from murine bone marrow cDNA using primers based on bovine BGP-A cDNA (see AAT78509). The encoded MGP-A precursor comprises signal peptide and propeptide sequences followed by 12 comprises signal peptide and propeptide sequences followed by 12 creminegative bacteria, fungitatively against Gram-positive and BGP-A (see AAW23724), exhibit activity against Gram-positive and cram-negative bacteria, fungi and viruses, specifically can be Staphylococcus aureus, Bscherichia coli, Candida albicans, Salmonella typhimurium and c. neoformans (claimed). They can be used in human or veterinary medicine (particularly to treat claimed) or as preservatives in food products or in water supplies (claimed). They can also be applied to crops to reduce supplies (claimed). They can also be applied to crops to reduce the supplies claimed). They can also be applied to crops to increase
                                                                                                                                    Antimicrobial (poly)peptide(s) from bovine and murine granulocytes useful therapeutically, as preservatives for food, in water treatment and in agriculture
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     heLeulleGlyGluAspGlyHisValTyrGluGlyArgGlyTrpAsnIle 100

The present invention describes an antibody that binds to a human protein (I) selected from: PRO381; PRO1269; PRO1401; PRO1755; PRO1780; PRO1434; PRO1927; PRO1567; PRO1269; PRO1403; PRO4344; PRO1567; PRO1269; PRO1269; PRO1364; PRO4364; PRO4364; PRO4367; PRO4367; PRO16056; PRO20626. (I) has anticancer activity and can be used to diagnose tumours in mammals, by detecting complex formation when the antibody is contacted with test cells. Increased expression of genes encoding (I) can also be detected to diagnose tumours. Agents which inhibit the activity of (I), especially the antibodies, or an antisense oligonaclectide which preferably by inducing cell death. Methods from the present invention can be used to identify compounds which inhibit the biological activity of (I). AAC58019 to AAC58102 represent PCR primers and hybridisation probes used in examples from the present human PRO sequences. AAC58103 to AAC58102 and AAB24021 to AAB24040 represent human
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Antibodies specific for PRO polypeptides, used to diagnose and inhibit the growth of tumors in mammals, and to identify inhibitors of PRO polypeptide activity or expression -

AAA37022 to AAA37144 encode the new isolated human transmembrane, receptor or secreted PRO polypeptides given in AAY99340 to AAY99462. The transmembrane and receptor PRO proteins can be used for screening of potential peptide or small molecule inhibitors of the relevant receptor/ligand interactions. The polypeptides and nucleotide sequences encoding then have various industrial applications, including uses as pharmaceutical and diagnostic agents. AAA37145 to AAA37330 represent PCR primers and hybridisation probes used in the isolation of the PRO polypeptides from the present invention.
small molecule inhibitors of the relevant receptor/ligand interactions

Secreted and transmembrane proteins and nucleic acids designated PRO, useful as hybridization probes, in chromosome and gene mapping and gene therapy

Claim 2; Fig 121; 787pp; English

The present invention relates to secreted and transmembrane proteins. These proteins and the DNA encoding them may be used as hybridization probes, in chromosome and gene mapping and in the generation of anti-sense RNA and DNA. They may also be used used to generate either transgenic animals or knockout animals which are in turn useful for development and screening of therapeutically useful reagents. The nucleic acids may also be used in gene therapy.

the tag7 DNA sequence are used to express recombinant tag7. Tag7 is used to produce and purify antibodies; to inhibit growth of mammalian tumours, especially for treating carcinoma (of liver, ovary, breast, cervix, lung prostate, colon/rectum, bladder, testis, stomach, pancreas, mouth, head and neck, squamous cell carcinoma or teratocarcinoma), sarcoma (Raposi's, stomach, pancreas, mouth, head somethy marker. The tag7 polypeptide inhibits tumour growth and induces apoptosis. The tag7 polypeptide inhibits tumour growth and induces apoptosis. The tag7 polypeptide inhibits tumour growth and induces apoptosis and detection of tag7 gene expression, and as primers. Antibodies against tag7 are used as reagents for detecting tag7, for isolating tag7 and therapeutically to inhibit or delay tumour tag7.
                                               New nucleic acid encoding tag7 - used to inhibit tumour growth and induce apoptosis, for treatment of carcinoma, sarcoma, melanoma and leukaemia
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 126 alProAlaLysArgAlaLeuArgAlaAlaLeuAsnLeuLeuGluCysGly 142
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    143 ValSerArgGlyPheLeuArgSerAsnTyrGluValLysGlyHisArgAs 159
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 317

The present invention relates to 12 secreted human proteins and the nucleotide sequences encoding them. The polynucleotide sequences given in AAA80606-A80623 encode the 12 secreted protein sequences given in AAA80606-B2593. The human secreted proteins have various activities of the proteins include: immunosuppressant; activities of the proteins include: immunosuppressant; anti-inflammatory; antiarthritic; anticonner; vulnerary; antiarthritic; anticonner; vulnerary; antiproliferative; and antifungal activity. The proteins, polypeptides, agonists and antifungal activity. The proteins, polypeptides, agonists and antifungal activity the proteins, and/or diagnose various disease, disorders and conditions examples of which include: immune disorders e.g. Addison's disease, rheumatoid arthritis, dermatitis, and multiple sclerosis; inflammatory disorders e.g. inflammatory bowel disease, Crohn's disease and nephitis; cardiovascular disorders e.g. coronary arteriosciarosis and mycoarditis; cardiovascular disorders e.g. coronary arteriosciarosis and mycoarditis; cancer e.g. melanoma and lymphoma. The proteins and polynucleotide

The PGRP DNA and proteins are useful for preventing, treating or ameliorating a medical condition in a mammal (claimed). PGRP is useful in augmenting the immune system in such areas as immune recognition, antison presentation and immune system activation. Antibodies or antagonists directed against these proteins may be useful in reducing or eliminating disorders associated with tumnour necrosis factor (TMF) and TNF-like cytokines, auch as endotoxic shock and autoimmune disorders and for treating infectious diseases including silicosis, sarcoidosis and idiopathic pulmonary fibrosis.
                                                                            Peptidoglycan recognition protein-like protein; PGRP-C; regulator; chondrosarcoma; immunosuppressive; antibacterial; anti-apoptotic; tumour necrosis factor; TNF; anti-infectious; mononuclear phagocyte; inhibitor; protein co-ordinate data; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Polynucleotide encoding peptidoglycan recognition protein-like protein, antibodies specific to it useful for preventing, treating conditions e.g. endotoxic shock and auto-immune disorders and infections in mammal

peptide (GP-A) homolog, Zgpal protein. Zgpal gene is located on human chromosome 1. Zgpal polypeptides are useful for producing antibodies which are useful for detecting cancer. Zgpal polypeptides having anti-microbial activity are useful for treating dental carries, canti-microbial activity are useful for treating dental carries, periodontal disease, thrush, gastrointestinal disease, urinary tract for infections, respiratory infections, vaginal infections, acquired immune deficiency syndrome (AIDS) and lung infections associated with cystic fibrosis and prevention of infection in skin and other epithelial wounds. Spal-cytokine fusion proteins are useful for enhancing in vivo killing of target tissues (epithelial cancers, and more specifically lung, ovarian and rectal cancers). Zgpal polypeptides, fragments, fusion covarians infections such as bacterial, viral or fungal infection and incroorganism infections such as bacterial, viral or fungal infection and antibodies, polynucleotides and polypeptides are useful for antibodies, polynucleotides and polypeptides are useful sequences are useful for cancering genetic diseases or cancers. Zgpal sequences are useful for 5 non-coding regions of a zgpal gene. Zgpal sequences are useful for 5 non-coding regions of a zgpal gene. Zgpal antibodies are useful for 5 squal genetal express zgpal, for screening expression libraries and cancerizing antibodies or as antagonists to block zgpal antibodies or as antagonists to block zgpal antibodies or as antagonists to block zgpal antibodies or as antagonists to conserve zgpal interaction of tagging cells that express zgpal, in a setving as antagonist to block zgpal antibodies or as antagonists to conserve zgpal interaction in cell cultury.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                therapy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                sArgAlaLeuArgAlaAlaLeuAsnLeuLeuGluCysGlyValSerArgG 146

The present sequence is a cDNA encoding human full length granulocyte peptide (GP-A) homolog, Zgpal protein. Zgpal gene is located on human chromosome 1. Zgpal polypeptides are useful for producing antibodies within are useful for detecting cancer. Zgpal polypeptides having anti-microbial activity are useful for treating dental carries, periodontal disease, thrush, gastrointestinal disease, uninary tract infections, respiratory infections, vaginal infections, acquired immune deficiency syndrome (AIDS) and lung infections associated with cystic fibrosis and prevention of infection in skin and other epithelial wounds. Expal-cytckine fusion proteins are useful for enhancing in vivo killing of target tissues (epithelial cancers, and more specifically lung, ovarian and rectal cancers). Zgpal polypeptides, fragments, fusion proteins are useful in in vitro studies of exogenous
                                                                                                                                                                                                                                                                                                         Humān; granulocyte peptide A; GP-A; Zgpal; cytostatic; antiinflammatory;

microorganism infections such as bacterial, viral or fungal infection and also to study epithelial cell defensin induction in cell culture. Zapal antibodies, polynuclectides and polypeptides are useful for detection of zapal polypeptide, mRNA or anti-zapal antibodies, thus serving as markers for detecting genetic diseases or cancers. Zapal sequences are useful as diagnostics in forensic DNA profiling and as probes or primers to clone 5' non-coding regions of a zapal gene. Zapal antibodies are useful for tagging cells that express zapal, for screening expression libraries and as neutralizing antibodies or as antagonists to block zapal activity in vitro and in vivo. Zapal gene is also useful in gene therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  GGTACCTGACTCCCAACTACCTGCTGGTGGGCCACAGTGATGTGGCCCGA 1065

expressed by keratinocytes (PGRP-K), wound healing tissues (PGRP-W) or chondrosarcoma tissue (PGRP-K), wound healing tissues (PGRP-W) or chondrosarcoma tissue (PGRP-C) are disclosed. The PGRP DNA and proteins are useful for preventing, treating or ameliorating a medical condition in a mammal (claimed). PGRP is useful in sugmenting the immune system in such areas as immune recognition, antigen presentation and immune system activation. Antibodies or antagonists directed against these proteins may be useful in reducing or eliminating disorders associated with tumour necrosis factor (TNF) and TNF-like cytokines, such as endotoxic shock and autoimmune disorders and for treating infectious diseases including silicosis, sarcoidosis and idiopathic
                                             Wound healing tissue peptidoglycan recognition protein-like protein cDNA.
                                                                            Peptidoglycan recognition protein-like protein; PGRP; PGRP-W; regulator; wound healing tissue; immunosuppressive; antibacterial; anti-apoptotic; tumour necrosis factor; TNF; anti-infectious; mononuclear phagocyte; inhibitor; protein co-ordinate data; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Polynucleotide encoding peptidoglycan recognition protein-like protein, antibodies specific to it useful for preventing, treating conditions e.g. endotoxic shock and auto-immune disorders and infections in mammal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          saps: 3

AAX4200 TO AAX4307 TEPICESENT HOVEL 3 explesses sequences, corresponding to human secreted proteins. AAX6451 to AXX65438 represent the EST-related proteins corresponding to AAX42265 to AXX65438 represent the EST-related proteins corresponding to AAX42265 to AXX43052. The 5' ESTS can be used for producing secreted human gene corresponds. The ESTS can identify and isolate 5' untranslated corresponds upstream regulatory regions which control the regions (UTRS) and upstream regulatory regions which control the credion, development stage, rate, and quantity of protein synthesis, as concluding a stability of maNA. The ESTS are also useful as probes for chromosome mapping, and to obtain full length cDNA clones. The ESTS can also be used in forensic procedures to identify individuals, or in calcable from abnormal gene expression. The products may also be used in forensic procedures conditionally and importing a polypeptide into a membrane, or importing a polypeptide into a membrane, or importing a polypeptide into a membrane, or importing a polypeptide into a membrane, or importing a polypeptide into a membrane, or importing a polypeptide into a membrane, or importing a polypeptide into a membrane, or importing a polypeptide into a membrane, or importing a polypeptide into a membrane, or importing a polypeptide into a membrane, or importing a polypeptide into a membrane, or importing a polypeptide into a membrane, or importing a polypeptide into a membrane, or importing a polypeptide into a membrane, or importing a polypeptide into a membrane, or importing a polypeptide into a membrane, or importing a polypeptide into a membrane and membrane and the identification of new secreted proteins is therapeutic value, and the identification of new secreted proteins is sequences used in the exemplification of the present invention.
                                                 AAZ42265 to AAZ43075 represent novel 5' expressed sequence tag (EST)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  247

This sequence is stated as encoding human truncated granulocyte peptide (GP-A) homolog, Zgpal protein. This sequence is a degenerate version of the coding region of SEQ ID NO: 7 shown in AAD04006. Zgpal gene is concated on human chromosome 1. Zgpal polypeptides are useful for located on human chromosome 1. Zgpal polypeptides are useful for producing antibodies which are useful for detecting cancer. Zgpal polypeptides having anti-microbial activity are useful for treating chartal carries, periodontal disease, thrush, gastrointestinal disease, urinary tract infections, respiratory infections, vaginal infections, caquired immune deficiency syndrome (AIDS) and lung infections associated with cystic fibrosis and prevention of infections in skin and other chancing in vivo killing of target tissues (epithelial cancers, and more specifically lung, ovarian and rectal cancers). Zgpal polypeptides, fragments, fusion proteins or agonists are useful in in vitro studies of exogenous microorganism infections such as bacterial, viral or fungal culture. Zgpal antibodies, polynucleotides and polypeptides are useful colluce. Zgpal antibodies, polynucleotides and polypeptides are useful scatection of zgpal polypeptide, mRNA or anti-zgpal antibodies, thus carefulng as markers for detecting genetic diseases or cancers. Zgpal colone 5' non-coding regions of a zgpal antibodies, caprossion libraries and as neutralizing antibodies or as antagonists to block the colone 5' non-coding regions of a zgpal gene is also useful in hower than an activity in vitro and in vivo. Zgpal gene is also useful in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Sequence 1107 BP; 186 A; 117 C; 201 G; 144 T; 459 other;

New granulocyte peptide homolog, zgpal polypeptide, for research applications, diagnosis and treatment of cancer, periodontal, gastrointestinal disease, urinary tract, skin and lung infections

Claim 3; Page 106-107; 114pp; English.

caquired immune deficiency syndrome (AIDS) and lung infections associated attented immune deficiency syndrome (AIDS) and lung infections associated with cystic fibrosis and prevention of infection in skin and other with cystic fibrosis and prevention of infection in skin and other central properties are useful for more specifically lung, ovarian and rectal cancers). Zgpal polypeptides, more specifically lung, ovarian and rectal cancers). Zgpal polypeptides of fragments, fusion proteins or agonists are useful in in vitro studies of infection and also to study epithelial cell defensin induction in cell infection and also to study epithelial cell defensin induction in cell culture. Zgpal antibodies, polynucleotides and polypeptide, mRNA or anti-zgpal antibodies, thus sevenences are useful as diagnostics in forensic DNA profiling and as probes or primers to clone 5' non-coding regions of a zgpal gene. Zgpal ontibodies are useful for tagging cells that express zgpal, for screening expression libraries and as neutralizing antibodies or as antagonists to block zgpal activity in vitro and in vivo. Zgpal gene is also useful in (GP-A) homolog, Zgpal protein. This sequence is a degenerate version of the coding region of SEQ ID NO: 4 shown in AAD04004. Zgpal gene is located on human chromosome 1. Zgpal polypeptides are useful for producing antibodies which are useful for detecting cancer. Zgpal polypeptides having anti-microbial activity are useful for treating dental carries, periodontal disease, thrush, gastrointestinal disease, urinary tract infections, respiratory infections, vaginal infections, sequence is stated as encoding human truncated granulocyte peptide
